

Tech Challenge FASE 5 — Hackathon SolidaryTech

Relatório de entrega final. Atende a todos os requisitos do PDF "Desafio - Tech Challenge Fase 5.pdf" (Hackathon de 2 meses, vale 90%).

Identificação do grupo

Participante	RM
Luiz Cesar Paulino da Costa	RM367925
Marcelo Oliveira	RM368372
Ricardo Pimenta	RM368911
Sergio Muller	RM368926

Turma: Pós-Graduação — DevOps & Arquitetura de Software — FIAP Pos Tech

Repositório: github.com/marcelosilva-dev/tech-challenge-5-fiap **Vídeos de demonstração:** pasta compartilhada no Google Drive — ver [seção dedicada](#) abaixo **Data de entrega:** 2026-07-17

Vídeos de demonstração

Gravação dividida em 5 partes. Pasta compartilhada (Google Drive): [Abrir pasta no Google Drive](#)

Ordem de visualização recomendada:

#	Arquivo	Conteúdo
1	01-overview-arquitetura.mkv	Pitch executivo + visão geral da arquitetura dos 3 microsserviços
2	02-github-actions-and-terraform.mkv	CI/CD com DevSecOps (GitHub Actions) + Infraestrutura como Código (Terraform)
3	03-gitops.mkv	GitOps em ação — ArgoCD sincronizando os Applications
4	04-sli-slo-sla-errorbudget.mkv	SRE — SLI/SLO/SLA, Error Budget e self-healing (redução de MTTR)
5	05-disaster-recovery.mkv	Disaster Recovery — Velero (backup) + Warm Standby cross-region

Sumário executivo

Este projeto constrói, orquestra, monitora, otimiza financeiramente e estabelece estratégia de resiliência para o ecossistema de microsserviços da **SolidaryTech** — plataforma sem fins lucrativos que conecta ONGs a doadores e voluntários.

3 microsserviços do upstream `dougl's/hackathon-DCLT` :

Serviço	Stack	Criticidade
ngo-service	Python/Flask + PostgreSQL	Importante
donation-service	Go + PostgreSQL + SQS	● Hot Path
volunteer-service	Python/Flask + DynamoDB	Importante

Todos rodam em **Amazon EKS** com: - ✓ IaC modular (Terraform 1.5+) - ✓ CI/CD com DevSecOps (GitHub Actions: Trivy + gosec + bandit + flake8 + golangci-lint) - ✓ GitOps (ArgoCD com auto-sync + self-heal) - ✓ Observabilidade total (Prometheus + Loki + Grafana + OpenTelemetry) - ✓ APM com Distributed Tracing (New Relic) - ✓ SRE com SLO/SLI/Error Budget - ✓ FinOps com tags rigorosas e forecast - ✓ ITSM com PagerDuty + Discord + Self-healing automatizado - ✓ Disaster Recovery cross-region (Warm Standby + DynamoDB Global Tables + Velero)

0. Fundação DevOps (Fases 1-4) — Requisito Obrigatório

Docker e Kubernetes

- **Dockerfiles otimizados multi-stage** em `microservices/<service>/Dockerfile` :
- **donation-service (Go)**: `golang:1.26-alpine` (builder) + `gcr.io/distroless/static-debian12:nonroot` (runtime) — imagem final ~10MB, zero CVEs de SO
- **ngo + volunteer (Python)**: `python:3.12-slim` com venv copiado entre stages, non-root user UID 10001, `PYTHONUNBUFFERED=1`
- **Deploy em EKS** (Amazon Elastic Kubernetes Service) — `terraform/modules/eks/`
- 3 ECR repositórios com `scan_on_push = true` e lifecycle policy (keep last 10)

Infraestrutura como Código

`terraform/` com 5 módulos reutilizáveis (`networking` , `eks` , `databases` , `messaging` , `ecr`) + 2 environments (`primary` em us-east-1, `dr` em us-west-2).

Backend remoto S3 + DynamoDB lock com nomes sufixados por `ACCOUNT_ID` para unicidade global.

CI/CD com DevSecOps

3 pipelines em `.github/workflows/ci-<service>.yaml` . Cada um:

Step	Ferramenta	Função
lint	flake8 / golangci-lint	Estilo de código
test	pytest / go test	Unit tests
SAST	bandit (Python) / gosec (Go)	Static Application Security Testing
SCA	Trivy filesystem scan	Software Composition Analysis
build	docker build multi-stage	Imagem amd64
container scan	Trivy	Scan da imagem final
push	docker push	ECR (tag = commit SHA + latest)
update GitOps	sed + git commit	Atualiza gitops/<svc>/deployment.yaml

GitOps

ArgoCD instalado em namespace `argocd`. 4 Applications declarativas em `argocd/applications.yaml` : - `solidarytech-shared` (namespace + Ingress) - `ngo-service`, `donation-service`, `volunteer-service`

Sync policy: `automated` com `prune: true` e `selfHeal: true`.

Observabilidade e APM

- **Métricas:** kube-prometheus-stack (Prometheus + Grafana + Alertmanager + node-exporter + kube-state-metrics)
- **Logs:** Loki (single-binary mode, 72h retention) + Promtail (DaemonSet)
- **Traces:** OpenTelemetry Collector como hub central, OTLP gRPC+HTTP
- **APM externo:** New Relic via OTLP HTTP exporter
- **Instrumentação:**
 - donation-service (Go): OTEL SDK manual com `otelhttp` middleware
 - ngo + volunteer (Python): `opentelemetry-distro` auto-instrumentation
- **Dashboard customizado:** Dashboards → SolidaryTech → SolidaryTech Overview

→ Detalhe técnico em [docs/SRE-SLO.md](#)

1. SRE — Confiabilidade e Golden Metrics

Definição de SLOs e SLIs

Documento completo em [docs/SRE-SLO.md](#). Resumo:

	donation-service (Hot Path)
SLI #1	Availability 5m (% requisições sem 5xx)
SLI #2	Latência P95 5m

	donation-service (Hot Path)
SLO Availability	≥ 99.9% (Error Budget: 43min/mês)
SLO Latência P95	< 300ms
SLA contratual ONGs	≥ 99.5% disponibilidade, P95 < 500ms

PrometheusRules em [gitops/monitoring/alerting/prometheus-rules.yaml](#) .

Dashboard SRE

Painel exclusivo em Grafana mostrando: - SLI Availability vs SLO 99.9% (com linha de threshold) - SLI Latency P95 vs SLO 300ms - Error Budget consumido nas últimas 24h / 7 dias / 30 dias - Logs do donation-service correlatos via Loki

MTTR — redução comprovada

Self-healing workflow ([.github/workflows/self-healing.yaml](#)) demonstrado: - **Execução real:** rollout restart completo em **43 segundos** - Run ID: [#26662680566](#) - **Discord notifica início + sucesso** automaticamente

Cadeia de redução de MTTR:

2. FinOps — Otimização Financeira

Documento completo em [docs/FINOPS-REPORT.md](#) . Resumo:

Tags obrigatórias aplicadas via `default_tags` no Terraform

```
default_tags {
  tags = {
    Project      = "SolidaryTech"
    Environment = "Production" # ou "DR"
```

```
CostCenter = "NGO-Core"
ManagedBy = "Terraform"
Repository = "marcelosilva-dev/tech-challenge-5-fiap"
}
```

Cobertura: 100% dos recursos Terraform-gerenciados (RDS, EKS, ECR, SQS, DynamoDB, VPC, EC2 nodes, EBS volumes).

Rightsizing aplicado

requests / limits configurados em `gitops/<svc>/deployment.yaml` :

Service	CPU req	Mem req	CPU lim	Mem lim
ngo	100m	128Mi	500m	512Mi
donation (Hot Path)	200m	128Mi	1000m	512Mi
volunteer	100m	128Mi	500m	512Mi

Forecast mensal

- **Sempre-on:** ~\$235/mês
- **Uso real (8h/dia × 22 dias):** ~\$74/mês (-70% via `destroy-all.sh`)

Recomendação prática nº 1 — DynamoDB Scan → GSI

Volunteer-service usa `Scan + FilterExpression` no `GET /volunteers/{ngo_id}` — **O(n)** com o tamanho da tabela.

Refatorando para `Query` com GSI `ngo_id-index` : - Cenário 10k voluntários: Scan = 10k RCUs vs GSI Query = 100 RCUs - **Economia: 99%+** naquele endpoint, qualquer escala

Detalhe técnico e código em [docs/FINOPS-REPORT.md](#) §3.

3. ITSM e AIOps — Gestão Preditiva

AIOps

New Relic Applied Intelligence habilitado (free tier 100GB/mês). Detecta anomalias comportamentais automáticas sem regras manuais:

- Latência atípica para a hora do dia
- Padrões de erro em endpoints raramente afetados
- Correlação automática entre alertas relacionados

ITSM — Ciclo de vida de incidente

Documento completo em [docs/ITSM-LIFECYCLE.md](#) . 6 fases:

- 1. **Deteção** (0-2min): Prometheus + AIOps + AWS Health
- 2. **Triagem** (2-5min): SRE on-call avalia, abre war-room Discord
- 3. **Mitigação** (5-15min): Self-healing automático OU runbook manual
- 4. **Resolução**: critérios objetivos (métricas saudáveis 5min)
- 5. **Comunicação**: stakeholders durante e pós (template em PT-BR)
- 6. **Post-Mortem** (48h depois): blameless, com Five Whys + action items

Routing de alertas (Alertmanager)

```
critical → PagerDuty (incident) + Discord (war-room) + GitHub Actions (self-heal)
warning → Discord apenas
SL0 burn → PagerDuty imediato + Discord + escala SRE
```

Config em [gitops/monitoring/alerting/alertmanager-config.yaml.example](#) .

Evidência empírica (Sprint 5.5)

3 alertas enviados, todos chegando em **ambos** canais: - PagerDuty incidents #4, #5, #6 no service `SolidaryTech-Production` - Discord webhook recebendo mensagens em formato Slack-block - Self-healing workflow #26662680566 demonstrado com 3 pods reiniciados em 43s

4. Multicloud, Segurança e Disaster Recovery

Plano de Continuidade de Negócios (PCN)

Documento executivo em [docs/PCN.md](#) . RTO/RPO formais:

Serviço	RTO	RPO	Como
donation-service (Hot Path)	15 min	5 min	RDS Cross-Region Read Replica + EKS DR escala 1 → 3
volunteer-service	5 min	seg	DynamoDB Global Tables (replicação nativa)
ngo-service	4h	24h	Velero backup diário

Estratégia de DR Prática — IMPLEMENTAMOS AMBAS as opções do PDF

Opção A (Backup): Velero com bucket S3 cross-region - Schedule diário às 03:00 UTC, retenção 30 dias - Bucket `solidarytech-velero-backups-<ACCOUNT>` em us-west-2 - Script: [scripts/install-velero.sh](#) - **Validado:** backup

manual Completed itemsBackedUp: 543

Opção B (Warm Standby): Terraform modular para região DR - [terraform/environments/dr/](#) em us-west-2 - EKS cluster skeleton (1 node) + RDS donation Cross-Region Read Replica - DynamoDB Global Tables (replicação ativa) - Failover via 1 comando: [scripts/dr-failover.sh](#) - DR drill mensal automatizado: [.github/workflows/dr-drill.yaml](#)

Detalhe técnico em [docs/DR-STRATEGY.md](#) .

Segurança

- **DevSecOps em CI:** SAST + SCA + container scan em todos os pushes (item 0)
- **Imagens distroless** no Go (zero CVEs de SO no donation-service)
- **IMDSv2 obrigatório** nos EKS nodes (mitigação SSRF)
- **K8s SecurityContext:** runAsNonRoot: true + allowPrivilegeEscalation: false + drop ALL capabilities
- **Secrets nunca commitados:** .gitignore cobre terraform.tfvars , _generated/ , newrelic-secret.yaml , alertmanager-config.yaml
- **GitGuardian:** alerta tratado durante Sprint 6 — Grafana password movida pra K8s Secret com openssl rand

5. Evidências visuais

Todos os screenshots em [docs/screenshots/](#) . Capturados em 2026-05-29 durante validação E2E do Sprint 7.

5.1 GitOps + ArgoCD

ArgoCD UI — 4 Applications Synced + Healthy :

Prova de que `solidaritytech-shared` , `ngo-service` , `donation-service` e `volunteer-service` estão totalmente sincronizados com o branch `main` do Git e em estado `Healthy` no cluster.

Pods em execução no cluster:

```
=== solidarytech ===
NAME                                READY   STATUS    RESTARTS   AGE
donation-db-init-x5z7m              0/1     Completed 0           3m20s
donation-service-7cdff86d74-b4qfv   1/1     Running   0           93m
donation-service-7cdff86d74-h5r9x   1/1     Running   0           93m
donation-service-7cdff86d74-qlzht   1/1     Running   0           93m
ngo-db-init-nvl84                   0/1     Completed 0           3m26s

☆	● volunteer-service	opentelemetry	2 ms	17.1 rps	0%	...

New Relic — Summary do donation-service (Hot Path):

New Relic — Distributed Trace waterfall:

Visualiza o caminho completo de uma requisição: HTTP → DB insert → SQS publish, com latência por span. Base para diagnóstico rápido de degradação.

5.4 ITSM — Gestão de Incidentes

PagerDuty — 3 incidents triggered via Events API V2:

PagerDuty

alerts

Capturing logs in real time

CRITICAL: ExplicitEnd_1780089712

Alert: ExplicitEnd_1780089712 - CRITICAL Summary: Alerta com endsAt explicito 1h futuro Description: Forcar fire prolongado

WARNING: PodNotReady

Alert: PodNotReady - WARNING Summary: Pod nao pronto: solidaritytech/donation-db-init-kkgtn Description: Pod nao atingiu Ready em 10min
Alert: PodNotReady - WARNING Summary: Pod nao pronto: solidaritytech/ngo-db-init-btlbf Description: Pod nao atingiu Ready em 10min

CRITICAL: LiveTest_1780089629

Alert: LiveTest_1780089629 - CRITICAL Summary: Live debug test Description: Capturing logs in real time

Alertmanager APP 18:45

CRITICAL: E2E_AlertmanagerFlow

Alert: E2E_AlertmanagerFlow - CRITICAL Summary: Validacao E2E: Alertmanager -> PagerDuty + Discord Description: Se voce ve este alerta tanto no PagerDuty quanto no Discord, a stack ITSM da SolidaryTech esta operacional.

CRITICAL: PostRestart_1780091226

Alert: PostRestart_1780091226 - CRITICAL Summary: Alerta APOS restart do Alertmanager Description: Se chegar no PagerDuty + Discord, fluxo E2E confirmado.

18:47

InfoInhibitor

Alert: InfoInhibitor - none Summary: Info-level alert inhibition. Description: This is an alert that is used to inhibit info alerts.
By themselves, the info-level alerts are sometimes very noisy, but they are relevant when combined with other alerts.
This alert fires whenever there's a severity="info" alert, and stops firing when another alert with a severity of 'warning' or 'critical' starts firing on the same namespace.
This alert should be routed to a null receiver and configured to inhibit alerts with severity="info".

Alertmanager APP 18:52

InfoInhibitor

Alert: InfoInhibitor - none Summary: Info-level alert inhibition. Description: This is an alert that is used to inhibit info alerts.
By themselves, the info-level alerts are sometimes very noisy, but they are relevant when combined with other alerts.
This alert fires whenever there's a severity="info" alert, and stops firing when another alert with a severity of 'warning' or 'critical' starts firing on the same namespace.
This alert should be routed to a null receiver and configured to inhibit alerts with severity="info".

5.5 Self-Healing — redução de MTTR

GitHub Actions — workflow self-healing executando rollout restart:

Run #26662680566 — 43 segundos para concluir rollout restart de 3 pods do `donation-service` com notificações Discord automáticas.

5.6 Disaster Recovery

Velero — backup completo cross-region (us-east-1 → us-west-2):

```
=== Velero ===
NAME                                READY    STATUS    RESTARTS    AGE
velero-6df7b6d86-g2xd8             1/1     Running   0            14m

NAME                                PHASE    LAST VALIDATED    AGE    DEFAULT
aws-us-west-2                       Available 27s              14m

NAME                                AGE
manual-sprint6-validation            13m
sprint7-screenshot-evidence          13m
```

DynamoDB Global Tables — replica us-west-2 ACTIVE:

```
luizcesarpaulinodacosta@Luizs-MacBook-Pro primary % echo "=== DynamoDB Global Tables status ===" && \
aws dynamodb describe-table --table-name SolidaryTechVolunteers \
--query 'Table.{Name:TableName,Status:TableStatus,Replicas:Replicas[*].[RegionName,ReplicaStatus]}' \
--output table
=== DynamoDB Global Tables status ===
-----
| DescribeTable |
+-----+
| Name | Status |
+-----+
| SolidaryTechVolunteers | ACTIVE |
+-----+
| Replicas |
+-----+
| us-west-2 | ACTIVE |
+-----+
```

5.7 FinOps — Tags em ação

AWS Tag Editor — 22 recursos com tag Project = SolidaryTech :

Resource search results (22)

Export 22 resources to CSV Manage tags of selected resources

Choose up to 500 resources for which you want to edit tags.

22 resources are loaded. Load more resources.

Filter resources

7. Stack de tecnologias

Categoria	Tecnologias
Cloud	AWS (EKS, RDS PostgreSQL, DynamoDB Global Tables, SQS, ECR, S3, NAT, EBS)
Container	Docker, distroless (Go), python:3.12-slim
Orchestration	Kubernetes 1.34, ArgoCD
IaC	Terraform 1.5+ (modular, multi-environment)
CI/CD	GitHub Actions com Trivy + gosec + bandit + flake8 + golangci-lint
Observability	Prometheus, Grafana, Loki, Promtail, OpenTelemetry Collector
APM	New Relic (OTLP)
ITSM	PagerDuty (Free), Discord webhook, GitHub Actions (self-healing)
AIOps	New Relic Applied Intelligence
DR	Velero (Opção A), Terraform Warm Standby (Opção B), DynamoDB Global Tables
Linguagens	Go 1.26 (Hot Path), Python 3.12 (ngo + volunteer)

8. Métricas do projeto

- **Sprints concluídas:** 7 (1 → 5 + 5.5 + 6)
- **Commits no repositório:** 25+ commits incrementais com mensagens detalhadas
- **Bugs descobertos e corrigidos** (com causa raiz documentada): 20+
- **Linhas de código adicionadas:** ~3.500 (Terraform + YAML + scripts + Go/Python)
- **Documentos técnicos:** 5 (PCN, DR-STRATEGY, ITSM-LIFECYCLE, SRE-SLO, FINOPS-REPORT) + este
